

Demonstrating Narrative Bindings: Linking Discourses to Knowledge Repositories at Text2Story@ECIR2021

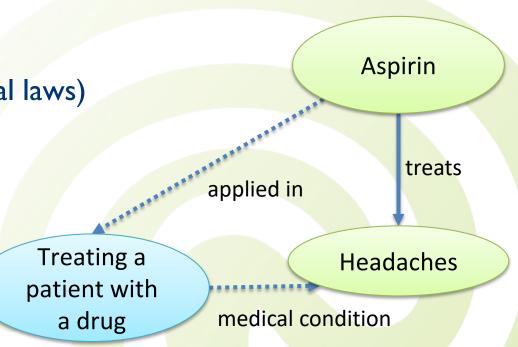

Hermann Kroll, Denis Nagel, Morris Kunz and Wolf-Tilo Balke

Institut für Informationssysteme
Technische Universität Braunschweig

What is a Narrative?

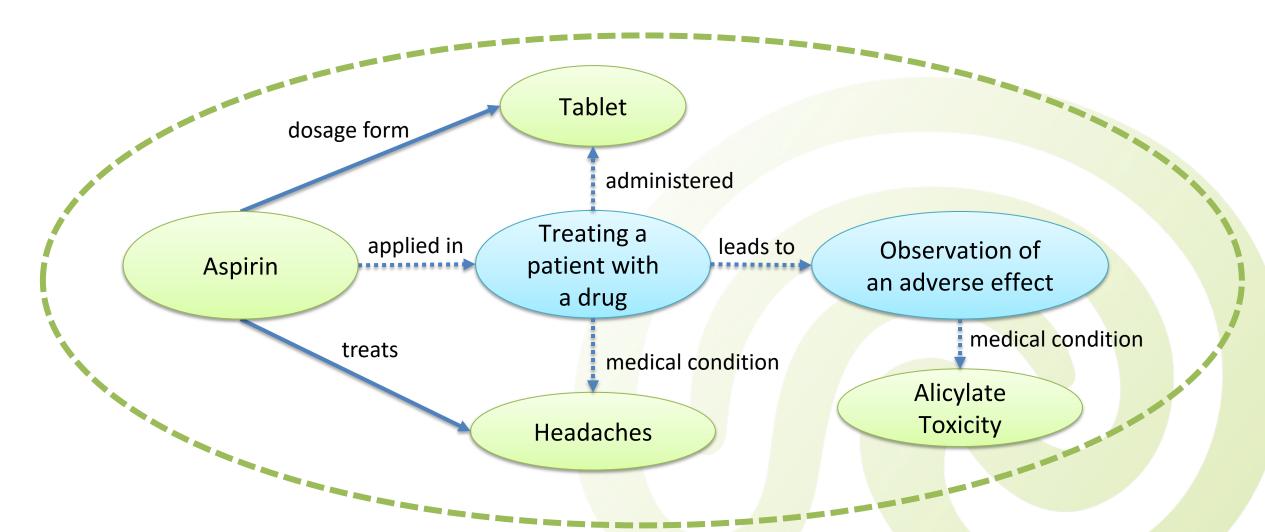

- "A narrative is a story, or more precisely, an argumentation, in which knowledge is shared."
- Components of a Narrative*:
 - Factual knowledge (properties, types, natural laws)
 - Events (labeled states or changes of states)
 - Narrative relations (basic structure)

*Kroll, H., Nagel, D., & Balke, W.T. Modeling Narrative Structures in Logical Overlays on Top of Knowledge Repositories. In: International Conference on Conceptual Modeling (pp. 250-260), 2020, Springer, Cham.

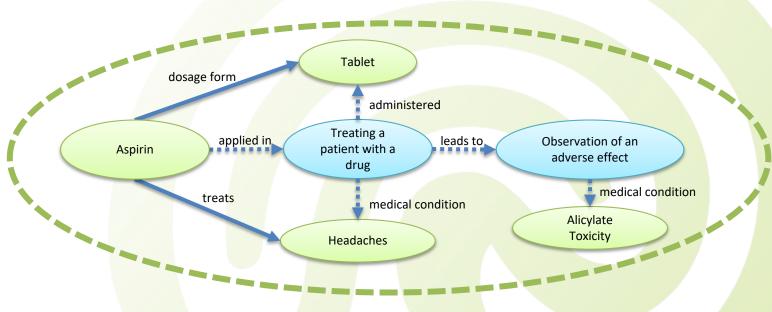

Example Narrative

What are the next steps?

- Our narrative model allows to design lines of arguments
 - But, it's just a syntactic representation
- The next research questions are:
 - How can we validate the narrative's plausibility?
 - And, what are the narrative's semantics?

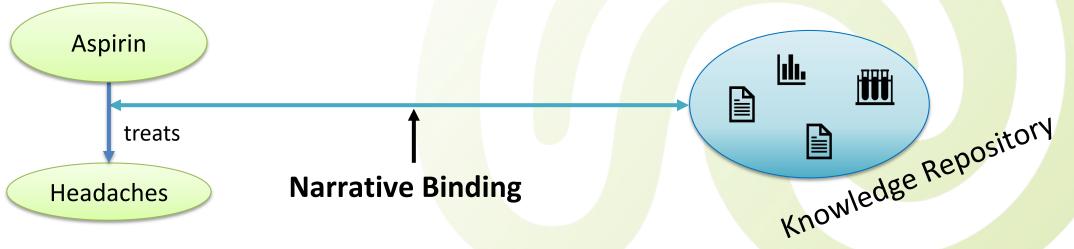

Validating a Narrative's Plausibility

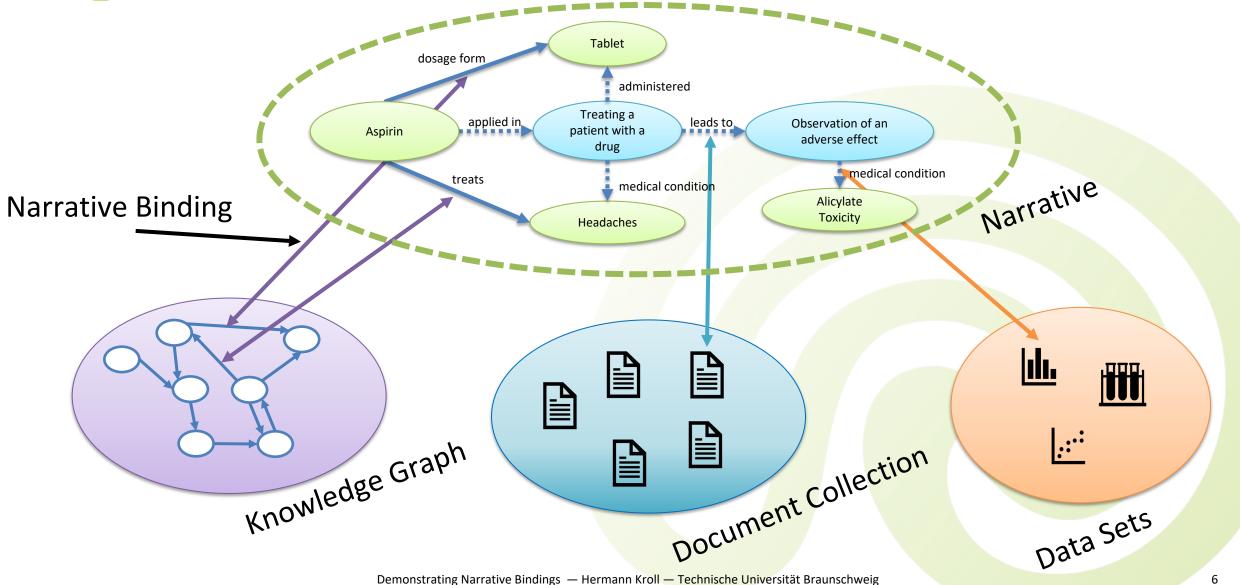

- We understand **plausibility** here as searching for **evidence**, i.e., some ground truth that supports a narrative's relation
 - For example, evidence for the relation Aspirin treats Headaches might be found in a biomedical database like the DrugBank

• So, we define **narrative bindings** as links between a narrative's relation and a knowledge repository

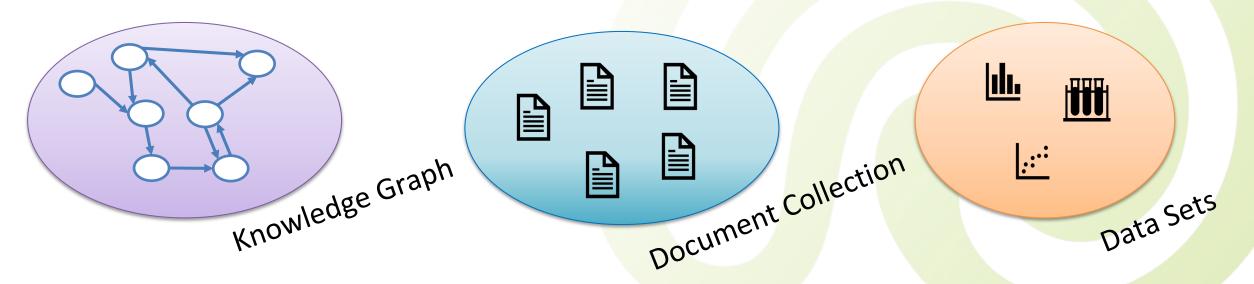

Narratives as Logical Overlays

Demonstrating Narrative Bindings

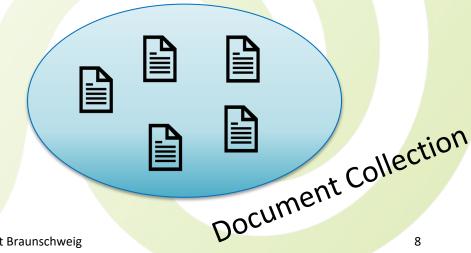

- How can we compute narrative bindings automatically?
 - Input: a narrative and a set of knowledge repositories
 - Output: narrative bindings between both
- We consider and discuss three different kinds of knowledge repositories:

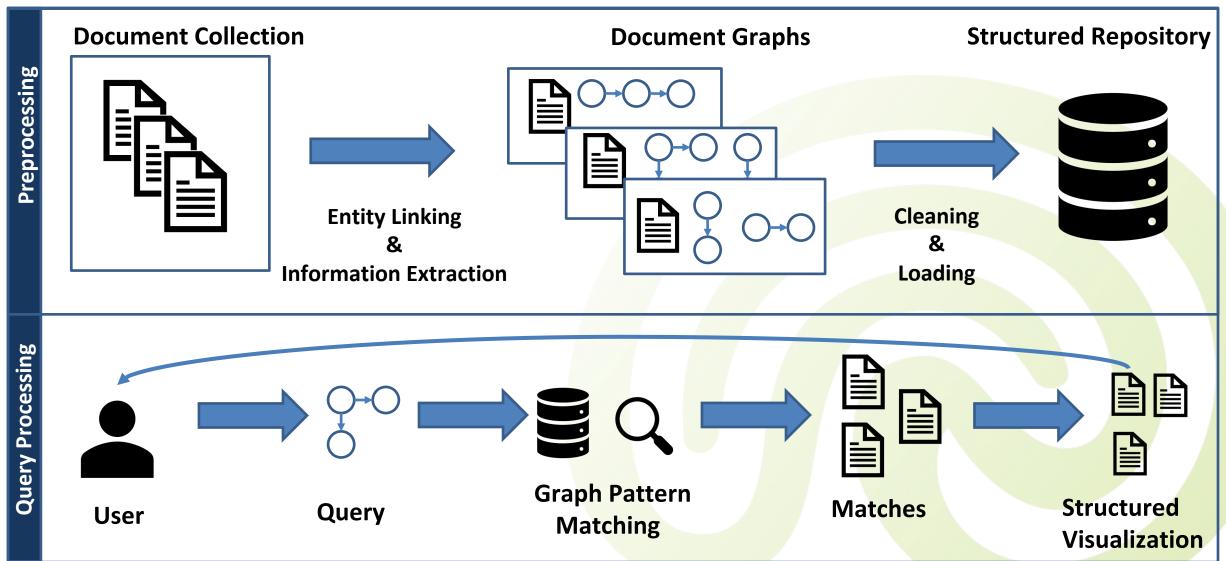

Bindings against document collections...

- We understand document collections as text documents
 - We ignore figures, tables, etc. for now
 - How can we compute narrative bindings against natural language texts?
- Information extraction converts unstructured into structured information
 - Supervised relation extraction requires training data
 - Open information extraction results in heterogenous extractions
- Information retrieval retrieves relevant information from text regarding a query
 - For example, textual entailment decides
 whether a text supports a given hypothesis

Prototype for Narrative Query Graphs

Narrative Query Graphs Live Demonstration

Institut für Informationssysteme
Technische Universität Braunschweig

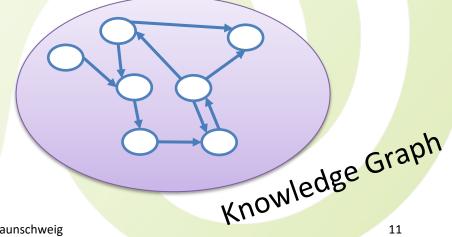

Bindings against Knowledge Graphs...

- Knowledge graphs are structured repositories of knowledge
 - Typically encoded in the Resource Description Framework (RDF)
 - Bindings could be obtained by query languages like SPARQL

Challenges:

- Link the narrative's nodes and relations to knowledge graph identifiers
 - A. Einstein Q937
 - Leads to PI542
- Linking text labels to identifiers may lead to errors, e.g., think about homonyms

Bindings against data sets...

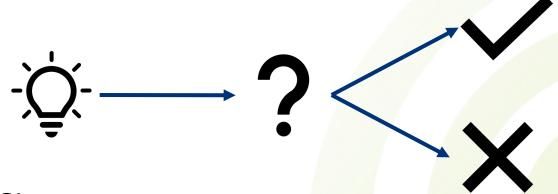

- Data sets usually do not have a common structure
 - Many different formats, no metadata, no clear description, etc.
- Our first two-phase algorithm works with relational data sets only
 - I. Phase: detect narrative's nodes in the data sets, i.e., are entities or events included in the data set?
 - 2. Phase: detect narrative's relation between nodes, i.e., is the relation between two nodes expressed in the data set?

Applications of Narrative Bindings

- Vision: Link scientific discourses to knowledge repositories
 - By computing suitable narrative bindings automatically
 - These bindings validate the narrative's plausibility

Applications:

- Test a hypothesis as a narrative, i.e., hypothesis is valid if narrative bindings exist
- Infer new knowledge with narratives including variables,
 i.e., find suitable variable substitutions and test if bindings do exist

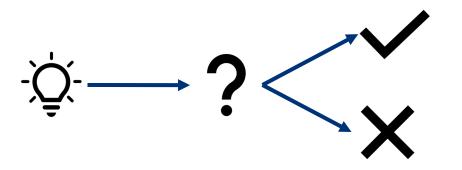

Conclusion

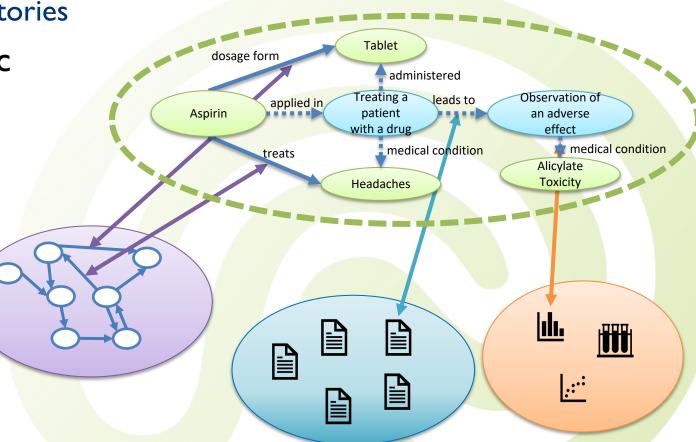

Narrative are designed as logical overlays

 Validate the narrative's plausibility by binding it against different knowledge repositories

 Demonstration of the automatic narrative binding computation

Open: How good and useful are narrative bindings in practice?
